- (54) Glycopeptide antibiotic derivatives.
- (57) The present invention provides glycopeptide antibiotic derivative compounds. These derivative compounds possess antibacterial activity aginst a wide variety of bacteria, including activity against vancomycin-resistant isolates. Methods of making and using these glycopeptide antibiotic derivative compounds are also provided.

EP 0 667 353 A1

N w improved antibiotics ar continually in demand, particularly for the tr atm nt of human dis as s. Increased potency, xpand d sp ctrum f bacterial inhibitin, increased din vivo efficacy, and improv d pharmaceutical proprities are some of the goals for improved antibiotics.

In the search for new antibiotics, structural modification of known antibitics is attempted when vir possible. The glycopeptide antibiotics have such complex structures that even small changes are difficult. Furthermore, it is difficult to predict the effect these changes will make in the antimicrobial and physiological properties. Processes for modifying known antibiotics and the new active derivatives made by such processes, therefore, continue to be of great importance.

Previously, N-alkyl and N-acyl derivatives of the glycopeptides vancomycin, A51568A, A51568B, M43A and M43D have been prepared (U.S. Patent Nos. 4,639,433, 4,643,987, and 4,698,327). Several of these compounds exhibited microbiological activity, including activity against vancomycin-resistant isolates. Nicas et al., Antimicrobial Agents and Chemotherapy, 33(9):1477-1481 (1989). In addition, European Patent Application Publication No. 0435503, published July 3, 1993, describes certain N-alkyl and N-acyl derivatives of the A82846 glycopeptides, factors A, B, and C.

The formula I compounds of this invention are new members of the glycopeptide group of antibiotics. These new compounds are derivatives of known glycopeptide antibiotics that include vancomycin (U.S. Patent 3,067,099); A82846A, A82846B, and A82846C (U.S. Patent 5,312,738, European Patent Publication 256,071 AI); PA-42867 factors A, C, and D (U.S. Patent 4,946,941 and European Patent Publication 231,111 A2); A83850 (U.S. Patent No. 5,187,082); avoparcin (U.S. Patent 3,338,786 and U.S. Patent 4,322,343); actinoidin, also known as K288 (J. Antibiotics Series A 14:141 (1961); helevecardin (Chem. Abstracts 110:17188 (1989) and Japanese Patent Application 86/157,397); galacardin (Chem. Abstracts 110:17188 (1989) and Japanese Patent Application 89/221,320); and M47767 (European Patent Publication 339,982). The references listed above which describe these glycopeptides are incorporated herein by reference.

Enterococci are important human pathogens. Infections caused by enterococci are generally difficult to treat. Glycopeptides, such as vancomycin and teicoplanin, have become important therapies in the treatment of infections due to enterococci. However, strains of Enterococcus faecium and E. faecalis have recently been isolated that are resistant to vancomycin and teicoplanin. Leclercq et al., "Plasmid Mediated Resistance to Vancomycin and Teicoplanin in Enterococcus Faecium, "The New England Journal of Medicine, 319(3):157-161 (1988), and Uttley et al., "Vancomycin-Resistant Enterococci," Lancet, 1:57-58 (1988). The isolates were also found to be resistant to other antibiotics. A recent survey found 7.9% of Enterococci in United States hospitals are now vancomycin resistant. "Nosocomial Enterococci Resistant to Vancomycin" Morbidity and Mortality Weekly Report 42 (30):597-598 (1993). In addition to their broad activity against gram-positive organisms, many of the glycopeptide compounds of this invention also exhibit improved antimicrobial activity against vancomycin-resistant isolates.

The present invention provides compounds of the formula I:

or salt ther of, wherein:

15

25

30

40

45

50

X and Y are ach independ ntly hydrogen or chloro;

R is hydrogen, 4-epi-vancosaminyl, actinosaminyl, or ristosaminyl;

R1 is hydrog n, or mannos;

R2 is -NH₂, -NHCH₃, or-N(CH₃)₂;

 R^3 is $-CH_2CH(CH_3)_2$, [ρ -OH, m-Cl]phenyl, ρ -rhamnose-phenyl, or [ρ -rhamnose-galactose]phenyl, [ρ -Cl]phenyl; lactose-galactose]phenyl, [ρ -CH₃O-rhamnose]phenyl;

R4 is -CH₂(CO)NH₂, benzyl, [p-OH]phenyl, or [p-OH, m-Cl]phenyl;

R⁵ is hydrogen, or mannose;

R6 is 4-epi-vancosaminyl, L-acosaminyl, L-ristosaminyl, or L-actinosaminyl;

 R^7 is (C_2-C_{16}) alkenyl, (C_2-C_{12}) alkynyl, (C_1-C_{12}) alkyl)- R_8 , (C_1-C_{12}) alkyl)-halo, (C_2-C_6) alkenyl)- R_8 , (C_1-C_{12}) alkyl)-O- R_8 , and is attached to the amino group of R^8 ;

R8 is selected from the group consisting of:

- a) multicyclic aryl unsubstituted or substituted with one or more substituents independently selected from the group consisting of:
 - (i) hydroxy,
 - (ii) halo,

5

- (iii) nitro,
- (iv) (C1-C6)alkyl,
- (v) (C₁-C₆)alkenyl,
- (vi) (C₁-C₆)alkynyl,
 - (vii) (C1-C6)alkoxy,
 - (''') to the (O O) all all
 - (viii) halo-(C1-C6)alkyl,
 - (ix) halo-(C₁-C₆)alkoxy,
 - (x) carbo-(C₁-C₆)alkoxy,
- 25 (xi) carbobenzyloxy,
 - (xii) carbobenzyloxy substituted with (C₁-C₆)alkyl, (C₁-C₆)alkoxy, halo, or nitro,
 - (xiii) a group of the formula $-S(O)_{n'}-R^9$, wherein n' is 0-2 and R^9 is (C_1-C_8) alkyl, phenyl, or phenyl substituted with (C_1-C_8) alkyl, (C_1-C_8) alkoxy, halo, or nitro, and
 - (xiv) a group of the formula $-C(O)N(R^{10})_2$ wherein each R^{10} substituent is independently hydrogen, (C_1-C_6) -alkyl, (C_1-C_6) -alkoxy, phenyl, or phenyl substituted with (C_1-C_6) -alkyl, (C_1-C_6) -alkoxy, halo, or nitro;
 - b) heteroaryl unsubstituted or substituted with one or more substituents independently selected from the group consisting of:
 - (i) halo,
 - (ii) (C1-C8)alkyl,
 - (iii) (C₁-C₆)alkoxy,
 - (iv) halo-(C₁-C₆)alkyl,
 - (v) halo-(C₁-C₆)alkoxy,
 - (vi) phenyl,
 - (vii) thiophenyl,
 - (viii) phenyl substituted with halo, (C₁-C₆)alkyl, (C₁-C₆)alkenyl, (C₁-C₆)alkynyl, (C₁-C₆)alkoxy, or nitro,
 - (ix) carbo-(C₁-C₆)alkoxy,
 - (x) carbobenzyloxy,
 - (xi) carbobenzyloxy substituted with (C₁-C₈)alkyl, (C₁-C₈) alkoxy, halo, or nitro,
 - (xii) a group of the formula -S(O)n-R9, as defined above,
 - (xiii) a group of the formula -C(O)N(R10)2 as defined above, and
 - (xiv) thienyl;
 - c) a group of the formula:

-1 A^1

wh rein A¹ is $-OC(A^2)_2-C(A^2)_2-O$, $-O-C(A^2)_2-O$, or $-C(A^2)_2-C(A^2)_2-C(A^2)_2-C(A^2)_2$, and ach A² substituent is independ ntly selected from hydrogen, (C_1-C_6) -alkyl, (C_1-C_6) alkoxy, and (C_4-C_{10}) -cycloalkyl;

d) a group of th formula:

5

10

15

20

25

30

wherein p is from 1 to 5; and

R¹¹ is independently selected from the group consisting of:

- (i) hydrogen,
- (ii) nitro,
- (iii) hydroxy,
 - (iv) halo,
 - (v) (C1-C8)alkyl,
 - (vi) (C1-C8)alkoxy,
 - (vii) (Cg-C12)alkyl,
 - (viii) (C2-C9)alkynyl,
 - (ix) (C9-C12)alkoxy,
 - (x) (C₁-C₃)alkoxy substituted with (C₁-C₃)alkoxy, hydroxy, halo(C₁-C₃)alkoxy, or (C₁-C₄)alkylthio,
 - (xi) (C₂-C₅)alkenyloxy,
 - (xii) (C₁-C₁₃)alkynyloxy
- (xiii) halo-(C1-C6)alkyl,
 - (xiv) halo-(C₁-C₆)alkoxy,

 - (xv) (C2-C6)alkylthio,
 - (xvi) (C2-C10)alkanoyloxy,
 - (xvii) carboxy-(C2-C4)alkenyl,
 - (xviii) (C₁-C₃)alkylsulfonyloxy,
 - (xix) carboxy-(C₁-C₃)alkyl,
 - (xx) N-[di(C_1 - C_3)-alkyl]amino-(C_1 - C_3)alkoxy,
 - (xxi) cyano-(C₁-C₆)alkoxy, and
 - (xxii) diphenyl-(C₁-C₆)alkyl,

with the proviso that when R11 is (C1-C8)alkyl, (C1-C8)alkoxy, or halo, p must be greater or equal to 2, or when R7 is (C1-C3 alkyl)-R8 then R11 is not hydrogen, (C1-C8)alkyl, (C1-C8)alkoxy, or halo;

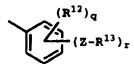

e) a group of the formula:

35

45

50

55

wherein q is 0 to 4; 40

R¹² is independently selected from the group consisting of:

- (i) halo,
- (ii) nitro,
- (iii) (C1-C8)alkyl,
- (iv) (C1-C6)alkoxy,
- (v) halo-(C₁-C₆)alkyl,
- (vi) halo-(C₁-C₆)alkoxy, and
- (vii) hydroxy, and
- (vii) (C1-C6)thioalkyl;

r is 1 to 5; provided that the sum of q and r is no greater than 5;

Z is selected from the group consisting of:

- (i) a single bond,
- (ii) divalent (C_1-C_6) alkyl unsubstituted or substituted with hydroxy, (C_1-C_6) alkyl, or (C_1-C_6) alkoxy,
- (iii) divalent (C2-C6)alk nyl,
- (iv) divalent (C2-C6)alkynyl, or
- (v) a group of the formula -(C(R¹⁴)₂)_s-R¹⁵- or -R¹⁵-(C(R¹⁴)₂)_s-, wh rein s is 0-6; wherein ach R¹⁴ substitu nt is independently s 1 cted from hydrogen, (C1-C6)-alkyl, or (C4-C10) cycloalkyl; and R15 is selected from -O-, -S-, -SO-, -SO₂-, -SO₂-O-, -C(O)-, -OC(O)-, -C(O)O-, -NH-, -N(C_1 - C_6 alkyl)-, and

-C(O)NH-, -NHC(O)-, N=N;

R¹³ is indep indently selected from the group consisting of:

- (i) (C₄-C₁₀)heter cyclyl,
- (ii) het r aryl,
- (iii) (C₄-C₁₀)cycloalkyl unsubstituted or substituted with (C₁-C₆)alkyl, or
- (iv) phenyl unsubstituted or substituted with 1 to 5 substituents independently selected from: halo, hydroxy, nitro, (C_1-C_{10}) alkyl, (C_1-C_{10}) alkoxy, halo- (C_1-C_3) alkoxy, halo- (C_1-C_3) alkyl, (C_1-C_3)
- f) (C_4-C_{10}) cycloalkyl unsubstituted or substituted with one or more substituents independently selected from the group consisting of:
 - (i) (C₁-C₈)alkyl,
 - (ii) (C₁-C₆)alkoxy,
 - (iii) (C1-C8)alkenyl,
 - (iv) (C₁-C₆)alkynyl,
 - (v) (C₄-C₁₀)cycloalkyl,
 - (vi) phenyl,
 - (vii) phenylthio,
 - (viii) phenyl substituted by nitro, halo, (C1-C8)alkanoyloxy, or carbocycloalkoxy, and
 - (ix) a group represented by the formula -Z-R13 wherein Z and R13 are as defined above; and
- g) a group of the formula:

25

30

35

45

55

5

10

15

20

wherein

A3 and A4 are each independently selected from

- (i) a bond,
- (ii) -O-,
- (iii) -S(O)t-, wherein t is 0 to 2,
- (iv) -C(R^{17})₂-, wherein each R^{17} substituent is independently selected from hydrogen, (C_1 - C_6)alkyl, hydroxy, (C_1 - C_6)alkyl, (C_1 - C_6)alkoxy, or both R^{17} substituents taken together are O,
- (v) -N(R¹⁸)₂-, wherein each R¹⁸ substituent is independently selected from hydrogen; (C₁-C₈)alkyl; (C₁-C₈)alkynyl; (C₁-C₈)alkynyl; (C₄-C₁₀)cycloalkyl; phenyl; phenyl substituted by nitro, halo, (C₁-C₈)alkanoyloxy; or both R¹⁸ substituents taken together are (C₄-C₁₀)cycloalkyl;

R16 is R12 or R13 as defined above; and

u is 0-4.

Another aspect of the invention relates to compositions for the treatment of susceptible bacterial infections comprising a compound of formula \underline{I} in combination with an acceptable pharmaceutical carrier. Methods for the treatment of susceptible bacterial infections with compositions of formula \underline{I} are also a part of this invention.

The alkyl substituents recited herein denote substituted or unsubstituted, straight or branched chain hydrocarbons of the length specified. The term "alkenyl" refers to a substituted or unsubstituted, straight or branched alkenyl chain of the length specified. The term "alkynyl" refers to a substituted or unsubstituted, straight or branched alkynyl chain of the length specified.

The alkoxy substituents recited herein represent an alkyl group attached through an oxygen bridge. The term "alkenoxy" represents a alkenyl chain of the specified length attached to an oxygen atom.

The term "multicyclic aryl" means a stable, saturated or unsaturated, substituted or unsubstituted, 9 to 10 membered organic fused bicyclic ring; a stable, saturated or unsaturated, substituted or unsubstituted 12 to 14 membered organic fused tricyclic ring; or a stable, saturated or unsaturated, substituted or unsubstituted 14 to 16 membered organic fused tetracyclic ring. The bicyclic ring may have 0 to 4 substituents, the tricyclic ring may have 0 to 6 substituents, and the tetracyclic ring may have 0 to 8 substituents. Typical multi-cyclic aryls include fluorenyl, napthyl, anthranyl, phenanthranyl, biphenylene and pyrenyl.

The term "heteroaryl" represents a stable, saturated runsaturated, substituted or unsubstituted, 4 to 7 member d organic mon cyclic ring having a hetero atom selected from S, O, and N; a stable, saturated or unsaturated, substituted or unsubstituted, 9 to 10 membered organic fused bicyclic ring having 1 to 2 hetero atoms selected from S, O, and N; or a stable, saturated or unsaturated, substituted in runsubstituted, 12 to 14 member degration or granic fused tricyclic ring having a heterology of the results of the saturated or unsaturated. The results of t

atoms of thes rings are ptionally oxidized, and the nitrog n h t ro atoms ar optionally quart rnized. Th monocyclic ring may hav 0 to 5 substitu nts. Th bicyclic ring may hav 0 to 7 substitu nts, and th tricyclic ring may hav 0 to 9 substituents. Typical heteroaryls include quinolyl, piperidyl, thienyl, pip r nyl, oxaflu renyl, pyridyl and benzothi nyl and the lik.

The term " (C_4-C_{10}) cycloalkyl" embraces substituents having from four to ten carbon atoms, such as cyclobutyl, cyclopentyl, cyclohexyl, and cycloheptyl which may be unsubstituted or substituted with substituents such as alkyl and phenyl. This term also embraces C_5 to C_{10} cycloalkenyl groups such as cyclopentenyl and cyclohexenyl. The term " (C_4-C_{10}) cycloalkyl" also embraces bicyclic and tricyclic cycloalkyls such as bicyclopentyl, bicyclohexyl, bicycloheptyl, and adamantyl.

The term "alkanoyloxy" represents an alkanoyl group attached through an oxygen bridge. These substituents may be substituted or unsubstituted, straight, or branched chains of the specified length.

The term "cyano-(C₁-C₆)alkoxy" represents a substituted or unsubstituted, straight or branched alkoxy chain having from one to six carbon atoms with a cyano moiety attached to it.

The term "divalent (C_1 - C_6)alkyl" represents an unsubstituted or substituted, straight or branched divalent alkyl chain having from one to six carbon atoms. Typical divalent (C_1 - C_6)alkyl groups include methylene, ethylene, propylene, isopropylene, butylene, isobutylene, sec-butylene, t-butylene, pentylene, neo-pentylene, and hexylene. Such divalent (C_1 - C_6)alkyl groups may be substituted with substituents such as alkyl, alkoxy, and hydroxy.

The term "divalent (C₂-C₆)alkenyl" represents a straight or branched divalent alkenyl chain having from two to six carbon atoms. Typical divalent (C₂-C₆)alkenyl include ethenyl, 1-propenyl, 2-propenyl, 1-butenyl, 2-butenyl and the like.

The term "divalent (C_2 - C_6)alkynyl" represents a straight or branched divalent alkynyl chain having from two to six carbon atoms. Typical divalent (C_2 - C_6)alkynyl include ethynylene, 1-propynylene, 2-propynylene, 1-butynylene, 2-butynylene and the like.

The term "halo" represents chloro, fluoro, bromo or iodo.

5

10

15

20

25

30

40

45

The term "halo- (C_1-C_6) alkyl" represents a straight or branched alkyl chain having from one to six carbon atoms with from 0 to 3 halogen atoms attached to each carbon. Typical halo- (C_1-C_6) alkyl groups include chloromethyl, 2-bromoethyl, 1-chloroisopropyl, 3-fluoropropyl, 2,3-dibromobutyl, 3-chloroisobutyl, iodo-t-butyl, tri-fluoromethyl, and the like.

The term "halo- (C_1-C_6) alkoxy" represents a straight or branched alkoxy chain having from one to six carbon atoms with from 0 to 3 halogen atoms attached to each carbon. Typical halo- (C_1-C_6) alkoxy groups include chloromethoxy, 2-bromoethoxy, 1-chloroisopropoxy, 3-fluoropropoxy, 2,3-dibromobutoxy, 3-chloroisobutoxy, iodo-t-butoxy, trifluoromethoxy, and the like.

The term "heterocyclyl" embraces saturated groups having three to ten ring members and which heterocyclic ring contains a hetero atom selected from oxygen, sulfur and nitrogen, examples of which are piperazinyl, morpholino, piperdyl, methylpiperdyl, azetidinyl, and aziridinyl.

The invention includes salts of the compounds defined by formula I. Although generally neutral, a compound of this invention can possess a sufficiently acidic, a sufficiently basic, or both functional groups, and accordingly react with any of a number of inorganic bases, and inorganic and organic acids, to form a pharmaceutically acceptable salt.

The term "pharmaceutically acceptable salt" as used herein, refers to salts of the compounds of the above formula I which are substantially non-toxic to living organisms. Typical pharmaceutically acceptable salts include those salts prepared by reaction of the compounds of the present invention with a pharmaceutically acceptable mineral or organic acid or an inorganic base. Such salts are known as acid addition and base addition salts.

Acids commonly employed to form acid addition salts are inorganic acids such as hydrochloric acid, hydrobromic acid, hydroiodic acid, sulfuric acid, phosphoric acid, and the like, and organic acids such as p-tol-uenesulfonic acid, methanesulfonic acid, oxalic acid, p-bromophenylsulfonic acid, carbonic acid, succinic acid, citric acid, benzoic acid, acetic acid, and the like. Examples of such pharmaceutically acceptable salts are the sulfate, pyrosulfate, bisulfate, sulfite, bisulfite, phosphate, monohydrogenphosphate, dihydrogenphosphate, metaphosphate, pyrophosphate, chloride, bromide, iodide, acetate, propionate, decanoate, caprylate, acrylate, formate, isobutyrate, caproate, heptanoate, propiolate, oxalate, malonate, succinate, suberate, sebacate, fumarate, maleate, butyne-1,4-dioate, hexyne-1,6-dioate, benzoate, chlorobenzoate, methylbenzoate, dinitrobenzoat, hydroxyb nzoat, m thoxyb nz at, phthalate, sulfonate, xyl nesulfonate, phenylacetate, ph nyl-propionate, phenylbutyrat, citrate, lactate, g-hydroxybutyrat, glycollate, tartrat, methanesulfonate, propanesulf nate, naphthalene-1-sulfonate, naphthalen -2-sulf nat, mandelate and the like. Preferred pharmaceutically acceptable acid addition salts are those form devith mineral acids such as hydrochloric acid and hydrobromic acid, and those form devith organic acids such as maleic acid, acetic acid, and methan sulfonic

acid.

10

35

40

45

50

55

Bas addition salts includ thos d rived from inorganic bases, such as ammonium r alkali or alkaline earth metal hydroxid s, carb nates, bicarbonat s, and the like. Such bas s useful in preparing the salts of this invention thus include sodium hydroxide, potassium hydroxide, ammonium hydroxide, potassium carbonate, sodium carbonate, sodium bicarbonate, potassium bicarbonate, calcium hydroxide, calcium carbonate, and the like. The potassium and sodium salt forms are particularly preferred.

It should be recognized that the particular counterion forming a part of any salt of this invention is not of a critical nature, so long as the salt as a whole is pharmacologically acceptable and as long as the counterion does not contribute undesired qualities to the salt as a whole.

The compounds of the present invention are prepared from compounds of the formula:

The compounds of formula II are defined in Table 1.

TABLE 1

*Abbreviations for the formula II compounds are: actin = actinosaminyl; acos = acosaminyl; 4-epi = 4-epi-vancosaminyl; gal = galactosyl; keto = 4-keto-vancosaminyl; man = mannose; rha = rhamnosyl; rha-gal = rhamnosyl-galactosyl; risto = ristosaminyl; van = vancosaminyl.

In a preferred embodiment of the invention, the formula I compounds are prepared from the A82846 antibiotics (A82846A, A82846B, and A82846C) and PA-42867-A. In a more preferred embodiment, the compounds of the present invention are prepared from A82846B ("A82846B derivatives"). A82846B is represented by formula I compounds wherein R is 4-epi-vancosaminyl, R¹ is hydrogen, R² is NHCH₃, R³ is CH₂CH(CH₃)₂, R⁴ is CH₂(CO)NH₂, R⁵ is hydrogen, R⁶ is 4-epi-vancosaminyl and X and Y are Cl. A82846B derivatives of the present invention having substituents at position R⁷ of formula I are list herein in the manner "R⁷-A82846B". For example, the compound "phenylbenzyl-A82846B" has a phenylbenzyl substituent at position R⁷ in formula I.

Preferred formula I compounds include those A82846B derivatives wherein R^7 is -(C_1 - C_{12} -alkyl)- R^8 , with -CH₃- R^8 being more preferred, and R^8 is an unsubstituted multicyclic aryl. Of this group, naphthylmethyl-A82846B, acenapthlenyl-methyl-A82846B, and fluorenylmethyl-A82846B are more pref rred.

Preferred formula I c mp unds also include thos A82846B d rivatives wh r in R^7 is -(C_1 - C_{12} -alkyl)- R^8 , with -CH₃- R^8 being more pref rred, and R^8 is an unsubstituted h t roaryl or a h teroaryl substituted by haloph nyl. Of this gr up, [1-oxa]fluor nylmethyl-A82846B, chlor phenylb nzoxazolemethyl-A82846B, and phenylthi nylmethyl-A82846B are mor preferred.

Furth r pref rred comp unds of formula I include those A82846B d rivatives wherein R^7 is -(C_1 - C_{12} -alkyl)- R^8 , with -CH₃- R^8 b ing more pref rred, and R^8 is a group of the f rmula:

5

10

15

20

30

35

40

45

wherein p is 1 and R¹¹¹ is selected from $(C_2 - C_5)$ alkenyloxy, halo- $(C_1 - C_6)$ alkoxy, $(C_2 - C_{10})$ alkanoyloxy, $(C_1 - C_3)$ alkoxy substituted with $(C_1 - C_4)$ alkylthio, and diphenyl- $(C_1 - C_6)$ alkyl. Of this group, trifluromethoxybenzyl-A82846B, diphenylmethylbenzyl-A82846B, thiopropylethoxybenzyl-A82846B, acetoxybenzyl-A82846B, non-anoyloxybenzyl-A82846B, and tetrafluoroethoxybenzyl-A82846B are more preferred.

Still further preferred compounds of formula I include those A82846B derivatives wherein R⁷ is -(C₁-C₁₂-alkyl)-R⁸, with -CH₃-R⁸ being more preferred, and R⁸ is a group of the formula:

wherein q is 1 to 5; r is 1; Z is selected from a single bond, divalent (C_1 - C_6)alkyl, divalent (C_2 - C_6)alkenyl, and -R¹⁵-($C(R^{14})_2)_8$ -, wherein R¹⁵ is selected from -O-, -S-, -SO₂-, and -OC(O)-, each R¹⁴ substituent is hydrogen, and s is 0 or 1; and R¹³ is selected from: (C_4 - C_{10})cycloalkyl; phenyl; and phenyl substituted by nitro, halo, (C_1 - C_{10})alkyl, (C_1 - C_{10})alkoxy, or halo(C_1 - C_3)alkyl. Of this group, chlorophenylbenzyl-A82846B, phenylbenzyl-A82846B, methoxy-phenylbenzyl-A82846B, methoxy-phenylbenzyl-A82846B, pentoxyphenylbenzyl-A82846B, pentoxyphenylbenzyl-A82846B, pentoxybenzyl-A82846B, fluorophenylbenzyl-A82846B, phenylethynylbenzyl-A82846B, phenoxybenzyl-A82846B, benzyloxybenzyl-A82846B, nitrophenylbenzyl-A82846B, chlorophenoxybenzyl-A82846B, benzyloxybenzyl-A82846B, benzyloxybenzyl-A82846B, benzyloxybenzyl-A82846B, nitrophenylbenzyl-A82846B, benzoyloxybenzyl-A82846B, cyclohexyloxybenzyl-A82846B, cyclohexyloxybenzyl-A82846B, cyclohexyloxybenzyl-A82846B, cyclohexylbenzyl-A82846B, cyclohexylbenzyl-A82846B, cyclohexylbenzyl-A82846B, cyclohexylbenzyl-A82846B, cyclohexylbenzyl-A82846B, chlorophenoxynitro-benzyl-A82846B, benzoyloxy-dimethoxybenzyl-A82846B, cyclohexanoyloxydimethylbenzyl-A82846B, trifluoromethylphenylbenzyl-A82846B, butylphenylthiobenzyl-A82846B, cyclohexanoyloxydimethylbenzyl-A82846B, trifluoromethylphenylbenzyl-A82846B, butylphenylthiobenzyl-A82846B, and bromophenylbenzyl-A82846B more preferred.

Still further preferred compounds of formula I include A82846B derivatives wherein R^7 is - $(C_1-C_{12}-alkyl)-R^8$, with - CH_3 - R^8 being more preferred, and R^8 is (C_4-C_{10}) cycloalkyl substituted with (C_4-C_{10}) cycloalkyl. Of this group of compounds, more preferred is cyclohexyl-cyclohexylmethyl-A82846B and butylcyclohexylmethyl-A82846B.

Formula I compounds that are prepared from A83850A or A83850B can be prepared from the reduced forms of these compounds. The reduced forms of compounds A83850A or A83850B are produced according to the method described in U.S. Pat. No. 5,187,082, which is incorporated herein by reference.

The compounds of this invention are prepared by reacting a formula II compound with an aldehyde to form an intermediate Schiff's base, which is subsequently reduced with a metal borohydride to give the desired N-alkyl amine.

In the first method of making the compounds of this invention, hereinafter Method A (described in Examples 1 and 2), the reaction for the formation of the Schiff's base is carried out under an inert atmosphere, such as nitrogen or argon, in a polar solvent, such as dimethylformamide (DMF) or methanol (MeOH), or a mixture of polar solvents, such as a mixture of dimethylformamide and methanol, at a temperature of about 25°C to about 100°C. The reaction is preferably carried out at a temperature from about 60°C to about 70°C for 30 minutes to 2 hours in a mixture of dimethylformamide and methanol, or in methanol. The intermediate Schiff's base is then reduced, preferably without isolation, to produce the corresponding N-alkyl derivative(s). The reduction of th Schiff's bas can be ffected using a ch mical reducing ag nt such as a m tal borohydride, for xample, sodium borohydrid or sodium cyan b rohydrid. The r duction reaction can be carried out in a polar riganic solvent, such as dim thylformamide, methanol, or a mixture f polar solvints, such as a mixture f dimethylformamid and methanol. The reduction reaction can bic carried out at a temperatur of about 25°C to about 100°C for 1 to 5 hours. The reduction reaction is preferably carried out using an excess of sodium cyanobor-

ohydride in a mixtur of dimethylformamide and methanol or in methanol at about 60°C to about 70°C for 1 to 2 hours. Method A is pref rabl for benzylic ald hydes.

In a s cond method of making compounds of this invention, hereinafter M thod B (d scribed in Exampl 3), th formation of th Schiff's bas is carri d out under an inert atmosph re, such as nitrogen or argon, in the presence of the reducing agent, sodium cyanoborohydride, in a polar solvent, such as dimethylformamide, methanol, or a mixture of polar solvents, such as a mixture of dimethylformamide and methanol, at a temperature of about 25°C to about 100°C for 1 to 5 hours. The reaction is preferably carried out at a temperature from about 60°C to about 70°C for 1 to 2 hours in a mixture of dimethylformamide and methanol. Method B is preferable for nonbenzylic aldehydes.

10

20

In a third method of making compounds of this invention, hereinafter Method C (described in Example 4), the formation of the Schiff's base is carried out a) under an inert atmosphere, such as nitrogen or argon, b) in the presence of the reducing agent, such as a metal borohydride, with sodium cyanoborohydride being most preferred, or a homogenous or heterogeneous catalytic hydrogenation agent(s), such as Crabtree's catalyst, Wilkinson's catalyst, palladium on carbon, platinum on carbon, or rhodium on carbon, c) in a polar solvent, such as dimethylformamide, methanol, or a mixture of polar solvents, such as a mixture of dimethylformamide and methanol, and d) at a temperature of about 25°C to about 100°C. The reaction is preferably carried out at a temperature from about 60°C to about 70°C in methanol. The reaction is allowed to continue for about 20 to about 28 hours, at which time the reaction mixture is adjusted to about pH 7.5 to about pH 10, with a pH of about 9.0 being preferred. The pH adjustment halts the reaction. Because the product is marginally soluble in polar solvents, the solvent of the reaction can be exchanged to an alcohol such as ethanol, butanol, or isopropanol, with isopropanol being preferred, to allow for precipitation of the product. Method C is a preferred method of this invention in view of the increased product yield provided by this method. Another advantage of this reaction scheme is the increased ratio of preferred product (products substituted at the amino group of the sugar denoted as R1 in Formula II compounds) to other products (products that are substituted at the amino groups of substitutents denoted as R and/or R3 of the Formula II compounds). By allowing the reaction to proceed for an extended period of time, such as 20 to 28 hours, products that are monosubstituted at positions denoted as R and R3 in the Formula II compounds are converted to disubstituted forms, making the preferred monosubstituted derivative easier to isolate.

The products of the reaction, obtained from either Method A, B, or C can be purified by preparative reverse-phase HPLC utilizing Waters C18 Nova-Pak columns with ultraviolet light (UV; 235 nm or 280 nm) detection. A 30 minute gradient solvent system consisting of 95% aqueous buffer/5% CH₃CN at time=0 minutes to 20% aqueous buffer/80% CH₃CN at time=30 minutes is typically used, where the aqueous buffer is either TEAP (0.5% aqueous triethylamine adjusted to pH=3 with phosphoric acid) or TFA (0.1% trifluoroacetic acid overall concentration).

HPLC analysis of the reaction mixtures and final purified products can be accomplished utilizing a Waters C18 MicroBonda-Pak column (typically 3.9 x 300 mm steel) or Waters Nova-pak C18 RCM column (8 x 100 mm) with UV (235 nm or 280 nm) detection. A 30 minute gradient solvent system consisting of 95% aqueous buffer/5% CH₃CN at time=0 minute to 20% aqueous buffer/80% CH₃CN at time=30 minutes is typically used, where the aqueous buffer is either TEAP (0.5% aqueous triethylamine adjusted to pH=3 with phosphoric acid) or TFA (0.1% trifluoroacetic acid overall concentration).

The ratio of the aldehyde to the formula II compound and the reaction conditions determines the products of the reaction. The monosubstituted derivatives are those derivatives where a hydrogen atom of the amino group at position R¹ in formula II is replaced by one of the substituents listed above for formula I. When using Methods A or B, described above, the formation of monosubstituted derivatives substituted at the amino group of the amino sugar at position R¹ in the formula II compounds is favored by using a slight excess of aldehyde, a shorter reaction time, and a lower temperature. As noted above, Method C favors the formation of the monosubstituted derivative. The monosubstituted derivative is preferred. A large excess of the aldehyde favors the formation of disubstituted and trisubstituted derivatives of the formula II compounds. The disubstituted derivatives are the derivatives where a hydrogen atom at two of the locations selected from the amino group at position R³ and the amino group of the amino sugars designated as R or R¹ in formula II, are replaced by the reduced aldehyde moiety. The trisubstituted derivatives are the derivatives where a hydrogen atom at three of the locations selected from the amino group at position R³ and the amino group of the amino sugars designated as R or R¹ in formula II, are replaced by the reduced aldehyde moiety.

Examples f compounds that hav b en prepared and are illustrativ of th formula I compounds are listed in Tables 2A and 2B. Tabl 2A lists compounds prepared by r acting an aldehyde with th glycopeptid A82846B. Table 2A lists th sidechain substitutions on th amino group of the 4-epi-vancosaminyl-O-glycosyl disaccharid of th A82846B compound. All of the compounds listed ar m nosubstitut d derivativ s.

Table 2B lists thos compounds that w re prepared by r acting an aldehyde with a varity of glycopeptid antibiotics oth r than A82846B. The compounds of Table 2B are monosubstituted at the amino group of the amino sugar designated as R¹ in formula II with the sidechain listed. All of the compounds listed are monosubstituted directions.

The formula I compounds have also shown in vivo antimicrobial activity against experimentally-induced infections in laboratory animals. When two doses of test compound were administered to mice experimentally 45 infected with the test organism, the activity observed was measured as an ED₅₀ value (effective dose in mg/kg to protect 50% of the test animals: see W. Wick et al., J. Bacteriol. 81, 233-235 (1961)). ED₅₀ values observed for illustrative compounds are given in Table 4.

One important aspect of the antimicrobial activity of many of the formula I compounds is their activity against vancomycin-resistant enterococci. This activity is illustrated in Table 5, which summarizes a comparison of the activity of illustrative compounds against representative vancomycin-resistant and vancomycin-susceptible enterococci (Enterococcus faecium and Enterococcus faecalis, mean geometric MIC (mcg/mL)), as determined using the standard broth micro-dilution assay. End points were read after 24-hour incubation. Mod-

ification of the amino sugar of the disaccharide moiety provides improved activity against vancomycin-resistant strains over the parent glycopeptide antibiotic.

A number of the lactic acid bacteria including all Leuconostocs, all Pediococci, and some Lactobacilli, are intrinsically resistant to vancomycin. With the increased use of vancomycin, infections due to these bacteria have been reported with increasing frequency in immunocompromised patients (Handwerger et al., Reviews of Infectious Disease 12:602-610 (1990); Ruoff et al., Journal of Clinical Microbiology 26:2064-2068 (1988)). One important aspect of the antimicrobial activity of the formula I compounds is their activity against the vancomycin-resistant lactic acid bacteria. The compounds of the present are useful in inhibiting the growth of vancomycin-resistant lactic bacteria such as Leuconostoc, Pedicocci, and Lactobacilli and thus, controlling opportunistic infections by this group of bacteria. This activity is illustrated in Table 6, which summarizes a comparison of the activity of illustrative compounds against representative vancomycin-resistant lactic acid bacteria (Pedicoccus acidilacti Pedicoccus pentosaceus, Leuconostoc lactis, Leuconostoc mesenteroides, Leuconostoc pseudomesenteroides, Leuconostoc citreum, and Lactobacillus confusus, mean geometric MIC (mcg/mL)), as determined using a standard agar dilution assay on brain-heart infusion agar.

Table 6
In Vitro Activity of Formula I Compounds
MIC (mcg/ml)/Compound

Pharmaceutical formulations of the formula I compounds are also part of this invention. Thus, the compound, preferably in the form of a pharmaceutically acceptable salt, can be formulat d for oral or parenteral administration for the therap utic or prophylactic treatm nt of bacterial inf ctions.

For xample, the compound can b admixed with conventional pharmaceutical carriers and excipients and used in th form of tablets, capsules, elixirs, suspensions, syrups, wafers, and th lik. Th compositions comprising a formula I compound will contain from about 0.1 to about 90% by weight of the active compound, and

more generally from about 10 to about 30%. The compositions may contain common carriers and excipients, such as corn starch or gelatin, lactose, sucrose, microcrystallin cellulose, kaolin, mannitol, dicalcium phosphate, sodium chl rid, and alginic acid.

Disintegrators commonly us d in the formulations of this invention include croscarm llose, microcrystalline cellulose, corn starch, sodium starch glycolate and alginic acid.

Tablet binders that can be included are acacia, methylcellulose, sodium carboxymethylcellulose, polyvinylpyrrolidone (Povidone), hydroxypropyl methylcellulose, sucrose, starch and ethylcellulose.

Lubricants that can be used include magnesium stearate or other metallic stearates, stearic acid, silicone fluid, talc, waxes, oils and colloidal silica.

Flavoring agents such as peppermint, oil of wintergreen, cherry flavoring or the like can also be used.

It may be desirable to add a coloring agent to make the dosage form more attractive in appearance or to help identify the product.

For intravenous (IV) use, a water soluble form of the antibiotic can be dissolved in one of the commonly used intravenous fluids and administered by infusion. Such fluids as, for example, physiological saline, Ringer's solution, or 5% dextrose solution can be used.

For intramuscular preparations, a sterile formulation of a suitable soluble salt form of the compound, for example the hydrochloride salt, can be dissolved and administered in a pharmaceutical diluent such as pyrogen-free water (distilled), physiological saline or 5% glucose solution. A suitable insoluble form of the compound may be prepared and administered as a suspension in an aqueous base or a pharmaceutically acceptable oil base, for example, an ester of a long chain fatty acid such as ethyl oleate.

For oral use, a sterile formulation of a suitable salt form of the antibiotic, for example, the hydrochloride salt, formulated in a diluent such as distilled or deionized water, is particularly useful.

Alternatively, the unit dosage form of the antibiotic can be a solution of the antibiotic, preferably in its salt form, in a suitable diluent in sterile, hermetically sealed ampoules. The concentration of the antibiotic in the unit dosage may vary, for example, from about 1 percent to about 50 percent depending on the particular form of the antibiotic and its solubility and the dose desired by the physician.

In a further aspect, this invention provides a method for treating infectious diseases, especially those caused by Gram-positive microorganisms, in animals. The compounds of this invention are particularly useful in treating infections caused by methicillin-resistant staphylococci. Also, the compounds are useful in treating infection due to enterococci. Examples of such diseases are severe staphylococcal infections, for example, staphylococcal endocarditis and staphylococcal septicemia. The animal may be either susceptible to, or infected with, the microorganism. The method comprises administering to the animal an amount of a formula I compound which is effective for this purpose. In general, an effective amount of a formula I compound is a dose between about 0.5 and about 100 mg/kg. A preferred dose is from about 1 to about 60 mg/kg of active compound. A typical daily dose for an adult human is from about 50 mg to about 5 g.

In practicing this method, the antibiotic can be administered in a single daily dose or in multiple doses per day. The treatment regimen may require administration over extended periods of time, for example, for several days or for from one to six weeks. The amount per administered dose or the total amount administered will depend on such factors as the nature and severity of the infection, the age and general health of the patient, the tolerance of the patient to the antibiotic and the microorganism or microorganisms involved in the infection.

A convenient method of practicing the treatment method is to administer the antibiotic via intravenous infusion. In this procedure a sterile formulation of a suitable soluble salt of the antibiotic is incorporated in a physiological fluid, such as 5% dextrose solution, and the resulting solution is infused slowly IV. Alternatively, the piggy-back method of IV infusion can also be used.

In order to illustrate more fully the operation of this invention, the following examples are provided, but are not to be construed as a limitation on the scope of the invention.

Preparation of Compound 2

A mixture of A82846B-triacetate, (2.25 g, 1.27 mmol, 1.0 equivalents (eq)) in 1:1 DMF/methanol (140 mL) und r an atmospher of argon was tr at d with 4-biphenylcarboxaldehyde (331 mg, 2.12 mmol, 1.7 eq). Th r sulting mixtur was heat d to 70°C and maintain d as such for 1.75-2 hours. The solution was then tr at d with sodium cyanoborohydrid (554 mg, 8.83 mmol, 6.9 q). Heating at 70°C was continued for an additional 1.75-2 hours aft r which the r action mixture was cooled to room temperature, concentrated in vacuo, diluted

with wat r (150 mL), and lyophilized to give a solid.

The solid was purified by preparativ reverse-phas high performance liquid chromatography (HPLC) using a Waters 3 x (40 x 100 mm) C18 Nova-Pak cartridge with Wat rs C18 Nova-pak guard insert and utilizing TEAP buffer system. The analytical method for analysis was: 0.2% TEA/phosphoric acid (TEAP), pH = 3, the gradient system at time 0 was 5% CH₃CN/94.8% H₂O with 0.2% TEAP held constant and at 20 minutes was 60% CH₃ON/39.8% H₂O with 0.2% TEAP held constant. The UV wavelength used was 235 nm and the flow rate was 2 ml/minute. Analysis was done using a Waters Nova-pak C18 RCM column (8 X 100mm) with a Nova-pak C18 guard insert. It is necessary to desalt the product after reverse phase purification when this HPLC method is used.

Desalting was accomplished by adding the purified product to 5-10 ml of H₂O. 1 N HCl was added dropwise with stirring to dissolve the sample. The pH at this point was approximately 1-3. The pH of the solution was then raised to 8.2 with 1 N NaOH. A white solid precipitated out of solution. The mixture was cooled, filtered, and dried under vacuum at room temperature for 8-15 hours to give the zwitter ion (or neutral compound) of the desired product, compound 2 (*p*-phenylbenzyl·A82846B), (1.02 g, 45%).

Preparation of Compound 4

A mixture of A82846B.triacetate (1.5 g, 0.848 mmol, 1.0 eq) in methanol (100 mL) under an atmosphere of argon was treated with ρ -phenoxybenzaldehyde (298 mg, 1.51 mmol, 1.8 eq). The resulting mixture was heated to reflux and maintained as such for 2 hours. The solution was then treated with sodium cyanoborohydride (326 mg, 5.18 mmol, 6.1 eq). Heating at reflux was continued for an additional 2 hours after which the reaction mixture was cooled to room temperature and evaporated to dryness *in vacuo*.

The product was purified by reverse-phase HPLC with a TFA buffer. The analytical method for analysis was accomplished by using a Waters Nova-pak C18 RCM column (8 x 100 mm) with a Nova-pak C18 guard insert, eluting with a 2.0 ml/minute linear gradient of 15% acetonitrile/0.1% TFA at time zero to 80% acetonitrile/0.1% TFA at 15 minutes. The fractions containing the products were detected by ultraviolet scan at 235 nm. The organic solvent of the desired fractions was removed and the mixture was lyophilized to a white solid to give 0.618 mg of p-phenoxybenzyl-A82846B compound 4-tris(trifluroacetate) salt (20% yield). No desalting or further purification was necessary. This method is also especially useful in the preparation of Compound 2 wherein phenylbenzaldehyde is one of the starting materials.

EXAMPLE 3

Method B

Preparation of Compound 176

A mixture of A82846B.triacetate (280 mg, 0.157 mmol, 1.0 eq) in 1:1 DMF/methanol (30 mL) was treated with 8-phenyloctanal (59 mg, 0.29 mmol, 1.8 eq) and sodium cyanoborohydride (60 mg, 0.95 mmol, 6.1 eq). The resulting mixture was heated, under an atmosphere of nitrogen, to 70°C and maintained as such for 1 hour. The reaction mixture was then cooled to room temperature and concentrated in vacuo to give a residue. Purification of the product was accomplished by reverse-phase preparative HPLC utilizing a Waters 2 x (40 x 100 mm) C18 Nova-Pak cartridge with Waters C18 Nova-Pak guard insert. Elution was accomplished with a 30 minute linear gradient (time=0 minutes 95% TEAP (0.5% aqueous triethylamine adjusted to pH=3 with phosphoric acid)/5% CH₃CN to t = 30 minutes 20% TEAP/80% CH₃CN) with a flow rate of 40 mL/minute and UV detection at 280 nm. The desired fraction was concentrated in vacuo then desalted with a Waters Sep-Pak cartridge as described below. This afforded compound 176 in 22% yield (60 mg).

The resulting compound was desalted as follows. A Waters Sep-Pak cartridge was pre-wet with methanol (2-3 column volumes) then conditioned with water (2-3 column volumes). The sample, dissolved in a minimum volume of water, was loaded onto the Sep-Pak column which was then washed with water (2-3 column volumes) to remove the unwanted salts. The product was then eluted with an appropriate solvent system, typically 1:1 CH₃CN/H₂O, CH₃CN, and/or methanol. The organic solvent component was r m ved *in vacuo* and th r sulting aqueous solution lyophiliz d to giv th final product.

EXAMPLE 4

5

10

15

30

Preparation of Compound 229

A three liter 3-necked flask was fitted with a condenser, nitrog n inlet and ov rh ad mechanical stirring apparatus. The flask was charged with pulverized A82846B acetate salt (20.0 g, 1.21 x 10⁻³ mol) and methanol (1000 mL) under a nitrogen atmosphere. 4'-chlorobiphenylcarboxaldehyde (2.88 g, 1.33 x 10⁻² mol, 1.1 eq.) was added to this stirred mixture, followed by methanol (500 mL). Finally, sodium cyanoborohydride (0.84 g, 1.33 x 10⁻² mol, 1.1 eq.) was added followed by methanol (500 mL). The resulting mixture was heated to reflux (about 65°C).

After 1 hour at reflux, the reaction mixture attained homogeneity. After 25 hours at reflux, the heat source was removed and the clear reaction mixture was measured with a pH meter (6.97 at 58.0°C). 1 N NaOH (22.8 mL) was added dropwise to adjust the pH to 9.0 (at 54.7°C). The flask was equipped with a distillation head and the mixture was concentrated under partial vacuum to a weight of 322.3 grams while maintaining the pot temperature between 40-45°C.

The distillation head was replaced with an addition funnel containing 500 mL of isopropanol (IPA). The IPA was added dropwise to the room temperature solution over 1 hour. After approximately 1/3 of the IPA was added, a granular precipitate formed. The remaining IPA was added at a faster rate after precipitation had commenced. The flask was weighed and found to hold 714.4 grams of the IPA/methanol slurry.

The flask was re-equipped with a still-head and distilled under partial vacuum to remove the remaining methanol. The resulting slurry (377.8 g) was allowed to chill in the freezer overnight. The crude product was filtered through a polypropylene pad and rinsed twice with 25 mL of cold IPA. After pulling dry on the funnel for 5 minutes, the material was placed in the vacuum oven to dry at 40°C. A light pink solid (22.87 g (theory = 22.43 g)) was recovered. HPLC analysis versus a standard indicated 68.0% weight percent of Compound 229 (4-[4-chlorophenyl]benzyl-A82846B] in the crude solid, which translated into a corrected crude yield of 69.3%.

The products of the reaction were analyzed by reverse-phase HPLC utilizing a Zorbax SB-C18 column with ultraviolet light (UV; 230 nm) detection. A 20 minute gradient solvent system consisting of 95% aqueous buffer/5% CH₃CN at time=20 minutes to 40% aqueous buffer/60% CH₃CN at time=20 minutes was used, where the aqueous buffer was TEAP (5 ml CH₃CN, 3 ml phosphoric acid in 1000 ml water).

EXAMPLE 5

Table 7 summarizes the preparation and certain physical characteristics of the exemplified compounds. The yield of the product was calculated using the amount of the formula II compound as the limiting reagent. The following terms are found in Table 6 and are defined here. "Method" refers to the method of synthesis as described in Examples 1 and 2, or 3. "Reagent Equivalents" refers to the molar equivalents of the aldehyde and reducing agent relative to the formula II compound. "FAB-MS (M+3H)" refers to Fast atom bombardmentmass spectrometry.

EXAMPLE 6

Capsule Formulation

Capsules containing 250 mg of Compound 2 are prepared using the following ingredients:

Ingredient	Weight
Compound 2 HCl salt	255.4 mg
Corn starch flowable powder	150 mg
Corn starch	144.6 mg

Compound 2 (HCl salt form, 255.4 mg), corn starch flowabl powder (150 mg) and corn starch (144.6 mg) are

bl nded in a suitabl mix runtil homogenous. The mixtur is us d to fill a hard g latin capsul to a net fill weight of 550 mg.

EXAMPLE 7

50

Capsule Formulation

Capsules containing 250 mg of Compound 229 are prepared using the following ingredients:

Ingredient	Weight
Compound 229 HCl salt	255.4 mg
Corn starch flowable powder	150 mg
Corn starch	144.6 mg

Compound 2 (HCl salt form, 255.4 mg), corn starch flowable powder (150 mg) and corn starch (144.6 mg) are blended in a suitable mixer until homogenous. The mixture is used to fill a hard gelatin capsule to a net fill weight of 550 mg.

EXAMPLE 8

Suspension Formulation

A sterile insoluble form of compound 2 is milled or screened to a particle size suitable for suspension. This particulate material is suspended in the following vehicle:

Ingredient	Weight
Lecithin	1%
Sodium citrate	2%
Propylparaben	0.015%
Distilled water	q.s. to desired volume

EXAMPLE 9

Suspension Formulation

A sterile insoluble form of compound 229 is milled or screened to a particle size suitable for suspension. This particulate material is suspended in the following vehicle:

Ingredient	Weight
Lecithin	1%
Sodium citrate	2%
Propylparaben	0.015%
Distilled water	q.s. to desired volume

EXAMPLE 10

Tablet Formulation

5 Tablets containing 250 mg of compound 2 are prepared with the following composition:

Ingredient	Weight
Lecithin	1%
Sodium citrate	2%
Propylparaben	0.015%
Distilled water	q.s. to desired volume

15

10

EXAMPLE 11

Tablet Formulation

20

Tablets containing 250 mg of compound 229 are prepared with the following composition:

Ingredient	Weight	
Lecithin	1%	
Sodium citrate	2%	
Propylparaben	0.015%	
Distilled water	q.s. to desired volume	

30

25

EXAMPLE 12

35 Tablet Formulation

Tablets containing 250 mg of compound 2 are prepared with the following composition:

Ingredient	Weight
Compound 2 HCl salt	255.4 mg
Microcrystalline cellulose	101.1 mg
Croscarmellose sodium	12.0 mg
Providone	12.0 mg
Magnesium stearate	3.0 mg
Stearic acid	4.0 mg
Purified water	0.16 ml

10

Claims

1. A compound of the formula:

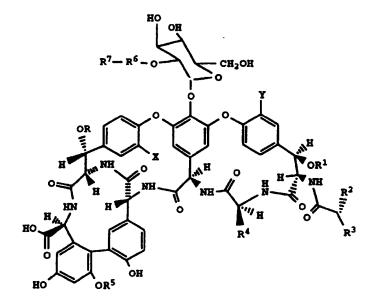

25 30 35

40

45

50

55

or salt thereof, wherein:

X and Y are each independently hydrogen or chloro;

R is hydrogen, 4-epi-vancosaminyl, actinosaminyl, or ristosaminyl;

R1 is hydrogen, or mannose;

 R^2 is $-NH_2$, $-NHCH_3$, or $-N(CH_3)_2$;

 R^3 is -CH₂CH(CH₃)₂, [p-OH, m-Cl]phenyl, p-rhamnose-phenyl, [p-rhamnose-galactose]phenyl, or [p-CH₃O-rhamnose]phenyl;

 R^4 is -CH₂(CO)NH₂, benzyl, [ρ -OH]phenyl, or [ρ -OH, m-Cl]phenyl;

R⁵ is hydrogen, or mannose;

R6 is 4-epi-vancosaminyl, L-acosaminyl, L-ristosaminyl, or L-actinosaminyl;

 R^7 is (C2-C16)alkenyl, (C2-C12)alkynyl, (C1-C12 alkyl)-R8, (C1-C12 alkyl)-halo, (C2-C6 alkenyl)-R8, (C2-C6 alkynyl)-R8, (C1-C12 alkyl)-O-R8, and is attached to the amino group of R^6 ;

R⁸ is selected from the group consisting of:

a) multicyclic aryl unsubstituted or substituted with on or mor substitu nts ind p nd ntly select d from the group consisting of:

(i) hydroxy,

- (ii) halo,
- (iii) nitro,
- (iv) (C₁-C₆)alkyl,
- (v) (C₁-C₆)alkenyl,
- (vi) (C₁-C₆)alkynyl,
- (vii) (C₁-C₆)alkoxy,
- (viii) halo-(C1-C6)alkyl,
- (ix) halo-(C1-C6)alkoxy,
- (x) carbo-(C₁-C₆)alkoxy,
- (xi) carbobenzyloxy,
- (xii) carbobenzyloxy substituted with (C_1-C_6) alkyl, (C_1-C_6) alkoxy, halo, or nitro,
- (xiii) a group of the formula $-S(O)_n-R^9$, wherein n' is 0-2 and R^9 is (C_1-C_6) alkyl, phenyl, or phenyl substituted with (C_1-C_6) alkyl, (C_1-C_6) alkoxy, halo, or nitro, and
- (xiv) a group of the formula $-C(O)N(R^{10})_2$ wherein each R^{10} substituent is independently hydrogen, $(C_1-C_2)_1$ -alkyl, $(C_1-C_3)_2$ -alkoxy, phenyl, or phenyl substituted with $(C_1-C_3)_2$ -alkyl, $(C_1-C_3)_3$ -alkoxy, phenyl, or phenyl substituted with $(C_1-C_3)_3$ -alkyl, $(C_1-C_3)_3$ -alkoxy, phenyl, or phenyl substituted with $(C_1-C_3)_3$ -alkyl, $(C_1-C_3)_3$ -alkoxy, phenyl, or phenyl substituted with $(C_1-C_3)_3$ -alkyl, $(C_1-C_3)_3$ -alkoxy, phenyl, or phenyl substituted with $(C_1-C_3)_3$ -alkyl, $(C_1-C_3)_3$ -alkoxy, phenyl, or phenyl substituted with $(C_1-C_3)_3$ -alkyl, $(C_1-C_3)_3$ -alkoxy, phenyl, or phenyl substituted with $(C_1-C_3)_3$ -alkyl, $(C_1-C_3)_3$ -alkoxy, phenyl, or phenyl substituted with $(C_1-C_3)_3$ -alkyl, $(C_1-C_3)_3$ -alkoxy, phenyl, or phenyl substituted with $(C_1-C_3)_3$ -alkyl, $(C_1-C_3)_3$ -alkoxy, phenyl, or phenyl substituted with $(C_1-C_3)_3$ -alkyl, $(C_1-C_3)_3$ -alkoxy, phenyl, or phenyl substituted with $(C_1-C_3)_3$ -alkyl, $(C_1-C$
- (C₁-C₆)-alkyl, (C₁-C₆)-alkoxy, phenyl, or phenyl substituted with (C₁-C₆)-alkyl, (C₁-C₆)-alkoxy, halo, or nitro;
- b) heteroaryl unsubstituted or substituted with one or more substituents independently selected from the group consisting of:
 - (i) halo,
 - (ii) (C₁-C₆)alkyl,
 - (iii) (C1-C6)alkoxy,
 - (iv) halo-(C1-C6)alkyl,
 - (v) halo-(C₁-C₆)alkoxy,
 - (vi) phenyl,
- (vii) thiophenyl,
 - (viii) phenyl substituted with halo, (C₁-C₆)alkyl, (C₁-C₆)alkenyl, (C₁-C₆)alkoxy, or nitro.
 - (ix) carbo-(C₁-C₆)alkoxy,
 - (x) carbobenzyloxy,
 - (xi) carbobenzyloxy substituted with (C₁-C₆)alkyl, (C₁-C₆) alkoxyl, halo, or nitro,
 - (xii) a group of the formula -S(O)_n-R⁹, as defined above,
 - (xiii) a group of the formula -C(O)N(R10)2 as defined above, and
 - (xiv) thienyl;
 - c) a group of the formula:

35

5

10

15

20

25

30

40

wherein A¹ is $-OC(A^2)_2-C(A^2)_2-O$, $-O-C(A^2)_2-O$, $-C(A^2)_2-O$, or $-C(A^2)_2-C(A^2)_2-C(A^2)_2-C(A^2)_2$ and each A² substituent is independently selected from hydrogen, (C_1-C_6) -alkyl, (C_1-C_6) alkoxy, and (C_4-C_{10}) -cycloalkyl;

d) a group of the formula:

50

55

45

wherein p is from 1 to 5; and

R¹¹ is independently selected from the group consisting of:

- (i) hydrogen,
- (ii) nitro,
- (iii) hydroxy,
- (iv) halo,
- (v) (C₁-C₈)alkyl,

(vi) (C₁-C₈)alkoxy,

(vii) (C9-C12)alkyl,

(viii) (C2-C9)alkynyl,

(ix) (Cg-C12)alkoxy,

(x) (C₁-C₃)alkoxy substituted with (C₁-C₃)alkoxy, hydroxy, halo(C₁-C₃)alkoxy, or (C₁-C₄)alkylthio,

(xi) (C2-C5)alkenyloxy,

(xii) (C₁-C₁₃)alkynyloxy

(xiii) halo-(C1-C6)alkyl,

(xiv) halo-(C₁-C₆)alkoxy,

(xv) (C₂-C₆)alkylthio,

(xvi) (C2-C10)alkanoyloxy,

(xvii) carboxy-(C2-C4)alkenyl,

(xviii) (C1-C3)alkylsulfonyloxy,

(xix) carboxy-(C1-C3)alkyl,

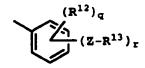

(xx) N-[di(C_1 - C_3)-alkyl]amino-(C_1 - C_3)alkoxy,

(xxi) cyano-(C1-C6)alkoxy, and

(xxii) diphenyl-(C₁-C₆)alkyl,

with the proviso that when R^{11} is (C_1-C_8) alkyl, (C_1-C_8) alkoxy, or halo, p must be greater or equal to 2, or when R^7 is (C_1-C_3) alkyl)- R^8 then R^{11} is not hydrogen, (C_1-C_8) alkyl, (C_1-C_8) alkoxy, or halo;

e) a group of the formula:

25

30

35

40

45

50

55

5

10

15

20

wherein q is 0 to 4;

R12 is independently selected from the group consisting of:

(i) halo,

(ii) nitro,

(iii) (C1-C6)alkyl,

(iv) (C1-C6)alkoxy,

(v) halo-(C1-C6)alkyl,

(vi) halo-(C1-C8)alkoxy, and

(vii) hydroxy, and

(vii) (C₁-C₆)thioalkyl;

r is 1 to 5; provided that the sum of q and r is no greater than 5;

Z is selected from the group consisting of:

(i) a single bond,

(ii) divalent (C₁-C₆)alkyl unsubstituted or substituted with hydroxy, (C₁-C₆)alkyl, or (C₁-C₆)alkoxy,

(iii) divalent (C2-C6)alkenyl,

(iv) divalent (C2-C6)alkynyl, or

(v) a group of the formula $-(C(R^{14})_2)s-R^{15}$ or $-R^{15}-(C(R^{14})_2)_s$, wherein s is 0-6; wherein each R^{14} substituent is independently selected from hydrogen, (C_1-C_6) -alkyl, or (C_4-C_{10}) cycloalkyl; and R^{15} is selected from -O-, -S-, -SO-, -SO₂-, -SO₂-O-, -C(O)-, -OC(O)-, -C(O)O-, -NH-, -N(C₁-C₆ alkyl)-, and -C(O)NH-, -NHC(O)-, N=N;

R¹³ is independently selected from the group consisting of:

(i) (C₄-C₁₀)heterocyclyl,

(ii) heteroaryl,

(iii) (C₄-C₁₀)cycloalkyl unsubstituted or substituted with (C₁-C₈)alkyl, or

(iv) phenyl unsubstituted or substituted with 1 to 5 substituents independently selected from: halo, hydroxy, nitro, (C_1-C_{10}) alkyl, (C_1-C_{10}) alkoxy, halo- (C_1-C_3) alkoxy, halo- (C_1-C_3) alkyl, (C_1-C_6) alkoxyphenyl, phenyl- (C_1-C_3) alkyl, (C_1-C_6) alkoxyph nyl, phenyl- (C_1-C_3) alkyl, and (C_1-C_6) alkyl-ph nyl;

f) (C_4-C_{10}) cycloalkyl unsubstituted or substituted with one or more substituents indep and antly selected from the group consisting of:

(i) (C₁-C₆)alkyl,

- (ii) (C₁-C₆)alkoxy,
- (iii) (C1-C6)alkenyl,
- (iv) (C₁-C₆)alkynyl,
- (v) (C₄-C₁₀)cycloalkyl,
- (vi) phenyl,
- (vii) phenylthio,
- (viii) phenyl substituted by nitro, halo, (C1-C6)alkanoyloxy, or carbocycloalkoxy, and
- (ix) a group represented by the formula -Z-R13 wherein Z and R13 are as defined above; and
- g) a group of the formula:

A³ (R¹⁶)

5

10

15

20

25

30

35

40

45

50

55

A³ and A⁴ are each independently selected from

(i) a bond,

wherein

- (ii) -O-,
- (iii) $-S(O)_{t-}$, wherein t is 0 to 2,
- (iv) -C(R^{17})₂-, wherein each R^{17} substituent is independently selected from hydrogen, (C_1 - C_6)alkyl, hydroxy, (C_1 - C_6)alkyl, (C_1 - C_6)alkoxy, or both R^{17} substituents taken together are O,
- (v) -N(R18)2-, wherein each R18 substituent is independently selected from hydrogen; (C1-C6)alkyl;
- (C_1-C_6) alkenyl; (C_1-C_6) alkynyl; (C_4-C_{10}) cycloalkyl; phenyl; phenyl substituted by nitro, halo, (C_1-C_6) alkanoyloxy; or both R^{18} substituents taken together are (C_4-C_{10}) cycloalkyl;

R¹⁶ is R¹² or R¹³ as defined above; and u is 0-4.

2. A compound of the formula:

R⁷-R⁶-OCH₂OH

OR

OR

OR

NH

NH

NH

NH

R⁴

R³

or salt thereof, wherein:

X and Y are each independently hydrogen or chloro;

R is hydrogen, 4- pi-vancosaminyl, actinosaminyl, or ristosaminyl;

R1 is hydrogen, or mannose;

R2 is -NH₂, -NHCH₃, or-N(CH₃)₂;

 R^3 is $-CH_2CH(CH_3)_2$, ph nyl, [p-OH,m-Cl]phenyl, p-rhamnose-ph nyl, or [p-rhamnose-galactose]ph nyl;

R4 is -CH₂(CO)NH₂, benzyl, [p-OH]ph nyl, or [p-OH, m-Cl]phenyl;

R⁵ is hydrogen, r mannose;

R6 is 4-epi-vancosaminyl, L-acosaminyl, L-ristosaminyl, or L-actinosaminyl;

R7 is -(CH₂)_n-R8, or -C(CH₃)CH-R8, and is attached to th amino group of R8;

n is 1-10;

5

10

15

20

25

30

35

40

45

50

55

R⁸ is selected from the group consisting of:

- a) multicyclic aryl unsubstituted or substituted with one or more substituents independently selected from the group consisting of:
 - (i) hydroxy,
 - (ii) halo,
 - (iii) nitro,
 - (iv) (C1-C6)alkyl,
 - (v) (C₁-C₆)alkenyl,
 - (vi) (C1-C6)alkynyl,
 - (vii) (C₁-C₆)alkoxy,
 - (viii) halo-(C1-C6)alkyl,
 - (ix) halo-(C1-C6)alkoxy,
 - (x) carbo-(C₁-C₆)alkoxy,

 - (xi) carbobenzyloxy,
 - (xii) carbobenzyloxy substituted with (C₁-C₆)alkyl, (C₁-C₆)alkoxy, halo, or nitro,
 - (xiii) a group of the formula -S(O)_n-R⁹, wherein n' is 0-2 and R⁹ is (C₁-C₆)alkyl, phenyl, or phenyl substituted with (C1-C6)alkyl, (C1-C6)alkoxy, halo, or nitro, and
 - (xiv) a group of the formula -C(O)N(R10)2 wherein each R10 substituent is independently hydrogen,
 - (C_1-C_6) -alkyl, (C_1-C_6) -alkoxy, phenyl, or phenyl substituted with (C_1-C_6) -alkyl, (C_1-C_6) -alkoxy, halo,
- b) heteroaryl unsubstituted or substituted with one or more substituents independently selected from the group consisting of:
 - (i) halo,
 - (ii) (C1-C6)alkyl,
 - (iii) (C₁-C₆)alkoxy,
 - (iv) halo-(C₁-C₆)alkyl,
 - (v) halo-(C₁-C₆)alkoxy,
 - (vi) phenyl,
 - (vii) thiophenyl,
 - (viii) phenyl substituted with halo, (C1-C6)alkyl, (C1-C6)alkenyl, (C1-C6)alkynyl, (C1-C6)alkoxy, or nitro,
 - (ix) carbo-(C₁-C₆)alkoxy,
 - (x) carbobenzyloxy,
 - (xi) carbobenzyloxy substituted with (C1-C6)alkyl, (C1-C6) alkoxy, halo, or nitro,
 - (xii) a group of the formula -S(O)n-R9, as defined above, and
 - (xiii) a group of the formula $-C(O)N(R^{10})_2$ as defined above;
- c) a group of the formula:

wherein A^1 is $-OC(A^2)_2-C(A^2)_2-O$, $-O-C(A^2)_2-O$, $-C(A^2)_2-O$, or $-C(A^2)_2-C(A^2)_2-C(A^2)_2-C(A^2)_2$, and each A² substituent is independently selected from hydrogen, (C₁-C₆)-alkyl, (C₁-C₆)alkoxy, and (C₄-C₁₀)cycloalkyl;

d) a group of the formula:

wh r in p is from 1 to 5; and

R¹¹ is independently sell cted from the group consisting of:

(i) nitro,

5

10

15

20

25

35

40

45

50

55

- (ii) hydroxy,
- (iii) (C9-C12)alkyl,
- (iv) (C₉-C₁₂)alkoxy,
- (v) (C2-C5)alkenyloxy,
- (vi) halo-(C1-C6)alkyl,
- (vii) halo-(C₁-C₆)alkoxy,
- (viii) (C2-C6)alkylthio,
- (ix) (C₁-C₆)alkynyl,
- (x) (C2-C10)alkanoyloxy,
- (xi) carboxy-(C2-C4)alkenyl,
- (xii) (C₁-C₃)alkylsulfonyloxy,
- (xiii) carboxy-(C₁-C₃)alkyl,
- (xiv) (C₁-C₃)alkoxy substituted with (C₁-C₃)alkoxy, hydroxy, halo(C₁-C₃)alkoxy, or (C₁-C₄)alkylthio,
- (xv) N-[di(C_1 - C_3)-alkyl]amino-(C_1 - C_3)alkoxy,
- (xvi) cyano-(C₁-C₆)alkoxy,
- (xvii) (C₁-C₁₂)alkyl, (C₁-C₁₂)alkoxy, or halo when p is greater or equal to 2,
- (xviii) diphenyl-(C₁-C₈)alkyl, and
- (xix) hydrogen, (C₁-C₆)alkyl, or (C₁-C₆)alkoxy when n greater or equal to 4;
- e) a group of the formula:

30 wherein q is 0 to 4;

R¹² is independently selected from the group consisting of:

- (i) halo,
- (ii) nitro,
- (iii) (C1-C6)alkyl,
- (iv) (C₁-C₆)alkoxy,
- (v) halo-(C₁-C₆)alkyi,
- (vi) halo-(C1-C6)alkoxy, and
- (vii) hydroxy, and
- (vii) (C1-C6)thioalkyl;

r is 1 to 5; provided that the sum of q and r is no greater than 5;

Z is selected from the group consisting of:

- (i) a single bond,
- (ii) divalent (C₁-C₆)alkyl unsubstituted or substituted with hydroxy, (C₁-C₆)alkyl, or (C₁-C₆)alkoxy,
- (iii) divalent (C2-C6)alkenyl,
- (iv) divalent (C2-C6)alkynyl, or
- (v) a group of the formula $-(C(R^{14})_2)_s R^{15}$ or $-R^{15}$ ($C(R^{14})_2)_s$, wherein s is 0-6; each R^{14} substituent is independently selected from hydrogen, (C₁-C₈)-alkyl, or (C₄-C₁₀) cycloalkyl; and R¹⁵ is selected from -O-, -S-, -SO-, -SO₂-, -SO₂-O-, -C(O)-, -OC(O)-, -C(O)O-, -NH-, -N(C₁-C₈ alkyl)-, and -C(O)NH-;

R¹³ is independently selected from the group consisting of:

- (i) (C₄-C₁₀)heterocyclyl,
- (ii) heteroaryl,
- (iii) (C₄-C₁₀)cycloalkyl unsubstituted or substituted with (C₁-C₆)alkyl, or
- (iv) phenyl unsubstituted or substituted with 1 to 5 substituents independently selected from: halo, hydroxy, nitro, (C_1-C_{10}) alkyl, (C_1-C_{10}) alkoxy, halo- (C_1-C_3) alkoxy, halo- (C_1-C_3) alkyl, (C_1-C_3) alkoxyph nyl, phenyl, phenyl- (C_1-C_3) alkyl, (C_1-C_6) alkoxyphenyl, ph nyl- (C_1-C_3) alkynyl, and (C_1-C_6) alkyl-
- f) (C4-C10) cycloalkyl unsubstitut dior substitut diwith one or more substituents independintly selict di from the group consisting of:

(i) (C₁-C₆)alkyl,

(ii) (C₁-C₈)alkoxy,

(iii) (C₁-C₆)alkenyl,

(iv) (C₁-C₆)alkynyl,

(v) (C₄-C₁₀)cycloalkyl,

(vi) phenyl,

(vii) phenylthio,

(viii) phenyl substituted by nitro, halo, (C1-C6)alkanoyloxy, or carbocycloalkoxy, and

(ix) a group represented by the formula -Z-R13 wherein Z and R13 are as defined above; and

g) a group of the formula:

15

20

25

35

40

45

5

10

wherein

A3 and A4 are each independently selected from

(i) a bond,

(ii) -O-,

S(iii) -(O),-, wherein t is 0 to 2,

(iv) $-C(R^{17})_2$ -, wherein each R^{17} substituent is independently selected from hydrogen, (C_1-C_6) alkyl, hydroxy, (C_1-C_6) alkyl, (C_1-C_6) alkoxy, or both R^{17} substituents taken together are O,

(v) -N(R^{18})₂-, wherein each R^{18} substituent is independently selected from hydrogen; (C_1 - C_6)alkyl;

 (C_1-C_6) alkenyl; (C_1-C_6) alkynyl; (C_4-C_{10}) cycloalkyl; phenyl; phenyl substituted by nitro, halo, (C_1-C_6) alkanoyloxy; or both R¹⁸ substituents taken together are (C_4-C_{10}) cycloalkyl;

R¹⁶ is R¹² or R¹³ as defined above; and u is 0-4.

- 30 3. A compound of Claim 1 wherein R is 4-epi-vancosaminyl, R¹ is hydrogen, R² is NHCH₃, R³ is CH₂CH(CH₃)₂, R⁴ is CH₂(CO)NH₂, R⁵ is hydrogen, R⁶ is 4-epi-vancosaminyl, and X and Y are Cl.
 - 4. A compound of Claim 2 wherein R is 4-epi-vancosaminyl, R¹ is hydrogen, R² is NHCH₃, R³ is CH₂CH(CH₃)₂, R⁴ is CH₂(CO)NH₂, R⁵ is hydrogen, R⁶ is 4-epi-vancosaminyl, and X and Y are Cl.

5. The compound 4-[4-chlorophenyl]benzyl-A82846B.

A pharmaceutical composition comprising a compound of Claim 1 to 5 or a pharmaceutically acceptable salt thereof, associated with one or more pharmaceutically acceptable carriers therefor.

7. A pharmaceutical composition as claimed in Claim 6 for use in treating susceptible bacterial infections.

. A process for the preparation of a compound of any one of Claims 1 to 5 which comprises

a) reacting in methanol at about 25°C to about 100°C under an inert atmosphere:

i) a glycopeptide antibiotic of the formula:

50

wherein X and Y are each independently hydrogen or chloro;

R is hydrogen, 4-epi-vancosaminyl, actinosaminyl, or ristosaminyl;

R1 is 4-epi-vancosaminyl, acosaminyl, ristosaminyl, 4-keto-vancosaminyl, or vancosaminyl;

R² is hydrogen, or mannose;

10

15

20

25

30

40

45

50

55

 R^3 is -NH₂, -NHCH₃, or-N(CH₃)₂;

R⁴ is -CH₂CH(CH₃)₂, [*p*-OH,*m*-Cl]phenyl, *p*-rhamnose-phenyl, [*p*-rhamnose-galactose]phenyl, [*p*-galactose-galactose]phenyl, or [*p*-CH₃O-rhamnose]phenyl;

R⁵ is -CH₂(CO)NH₂, benzyl, [p-OH]phenyl, or [p-OH, m-Cl]phenyl;

R⁶ is hydrogen, or mannose, with

ii) an aldehyde corresponding to the group R7 as defined in Claim 1 at about 25°C to about 100°C;

b) continuing the reaction until formation of a Schiff's base; and

c) reducing the Schiff's base by addition of a metal borohydride to the mixture at 25°C to about 100°C.

9. A process for the preparation of a compound of any one of Claim 1 to 5 which comprises reacting in a polar solvent at about 25°C to about 100°C under an inert atmosphere:

i) a glycopeptide antibiotic of the formula:

wherein X and Y ar ach indep indently hydrogen or chloro;

5

R is hydrogen, 4- pi-vancosaminyl, actinosaminyl, or ristosaminyl; R1 is 4-epi-vancosaminyl, acosaminyl, ristosaminyl, 4-k to-vancosaminyl, or vancosaminyl; R2 is hydrogen, or mannos; R^3 is -NH₂, -NHCH₃, or-N(CH₃)₂; R^4 is $-CH_2CH(CH_3)_2$, [p-OH,m-Cl]phenyl, p-rhamnose-phenyl, [p-rhamnose-galactose]phenyl, $\label{eq:constraint} \mbox{\it [ρ-galactose-galactose] phenyl, or $$[\rho$-CH$_3O-rhamnose]$ phenyl;}$ R⁵ is -CH₂(CO)NH₂, benzyl, [p-OH]phenyl, or [p-OH, m-Cl]phenyl; R⁶ is hydrogen, or mannose, with ii) an aldehyde corresponding to the group ${\sf R}^7$ as defined in Claim 1, in the presence of 10 iii) a reducing agent selected from a metal borohydride, and a homogeneous or heterogeneous catalytic hydrogenation agent or agents; for a time sufficient to produce a compound of Claim 1. 10. The process of Claim 9 wherein the reducing agent is sodium cyanoborohydride, and the reaction is car-15 ried out for about 20 to 28 hours at a temperature of about 60°C to about 70°C. 11. The process of Claim 9 wherein the aldehyde is 4'biphenylcarboxaldehyde. 20 25 30 35 40 45 50 55
